Flue Guard™ Longitudinal

Patent Pending 14/324,840

The **Flue Guard™ - Longitudinal** was created as an alternative to existing pallet back stops that are large and expensive. This includes pallet stop beams, wire mesh panels, wire decks ledge stops, strapping and other bolt-on equipment. Keep your warehouse safe and in compliance with local fire codes with the Flue Guard. The Flue Guard is the strongest, most cost-effective flue space solution that provides a fixed 6" (or more) longitudinal flue space for industrial pallet rack applications.

Features:

- Designed to meet International Building Code (IBC2012) and NFPA 13 where applicable
- Allows heat and smoke to escape through the flue to sprinklers above, initiating sprinklers quicker
- Improves sprinkler performance by allowing water to reach lower inventory through open flue space
- Prevents pallet push through
- Installs easily and securely with (4) prepunched and countersunk holes, tek screws included
- Stock Sizes: 12" (6" flue), 18" (12" flue) and 24" (18" flue)
- Rigid box design and robotically welded for superior strength

Advantages:

- Quick and easy install on new or retrofitted installations
- Fits beams of any length or depth, no need to order different length beams
- Controls pallet placement to keep flue space consistent
- Only one pallet stop for every two pallets
- Same height as a 5" pallet thereby preventing product damage – contacts wood pallet (instead of inventory)
- Compatible with wire decking
- Full customization to fit your unique facility, rack and fire sprinkler protection schemes
- Approved by Fire Consultants, Fire Engineers and Fire Marshals around the USA

Pricing Advantages:

- Half the price and size of most pallet stops
- Easier and quicker installation saves labor costs
- Compact shipping and smaller size saves freight costs
