

Flue Guard™ Transverse

US Patent #7,857,152

The Original

The Flue Guard - Transverse Original was designed to keep boxes from encroaching into the transverse flue space in order to improve sprinkler penetration to products within the pallet rack structure. These flue stops meet NFPA standards and all fire codes in the US. The easy to use brackets allow for quick and effortless installation.

Applications

Archive Storage - Allows your sprinkler system to function as designed by providing a 3" clearance between rack and stored material. (Combined with 3" rack post width totals 6" flue space. One Flue Guard per box level is suggested for maximum effectiveness.

Furniture and Mattress Warehousing - Keeps valuable items out of the required flue space.

Hand Loaded Boxes - Small or odd-shaped items can be kept out of the flue space. Use as many Flue Guards per level as necessary. Flue Guard's smooth curved surface prevents hangups and snags. Boxes slide on and off easily.

Boltless front & rear connections - spring-loaded Flue Guard is easy for maintenance personnel to install from the aisle side of the rack without removing any items.

Satisfies insurance company guidelines and local building inspector criteria - (may be required by International Fire Code®).

Heavy Duty Version - For deep rack shelves (>72")
